Images – Capturing and Processing

Image Concepts

- ❑ An image is a function of intensity values over a 2D plane $I(r,s)$
- ❑ Sample function at discrete intervals to represent an image in digital form
 - ❑ matrix of intensity values for each color plane
 - ❑ intensity typically represented with 8 bits
- ❑ Sample points are called **pixels**

Image Representations

- ❑ Black and white image
 - ❑ single color plane with 2 bits
- ❑ Grey scale image
 - ❑ single color plane with 8 bits
- ❑ Color image
 - ❑ three color planes each with 8 bits
 - ❑ RGB, CMY, YIQ, etc.
- ❑ Indexed color image
 - ❑ single plane that indexes a color table
- ❑ Compressed images
 - ❑ TIFF, JPEG, BMP, etc.

Image Representation Example

24 bit RGB Representation (uncompressed)

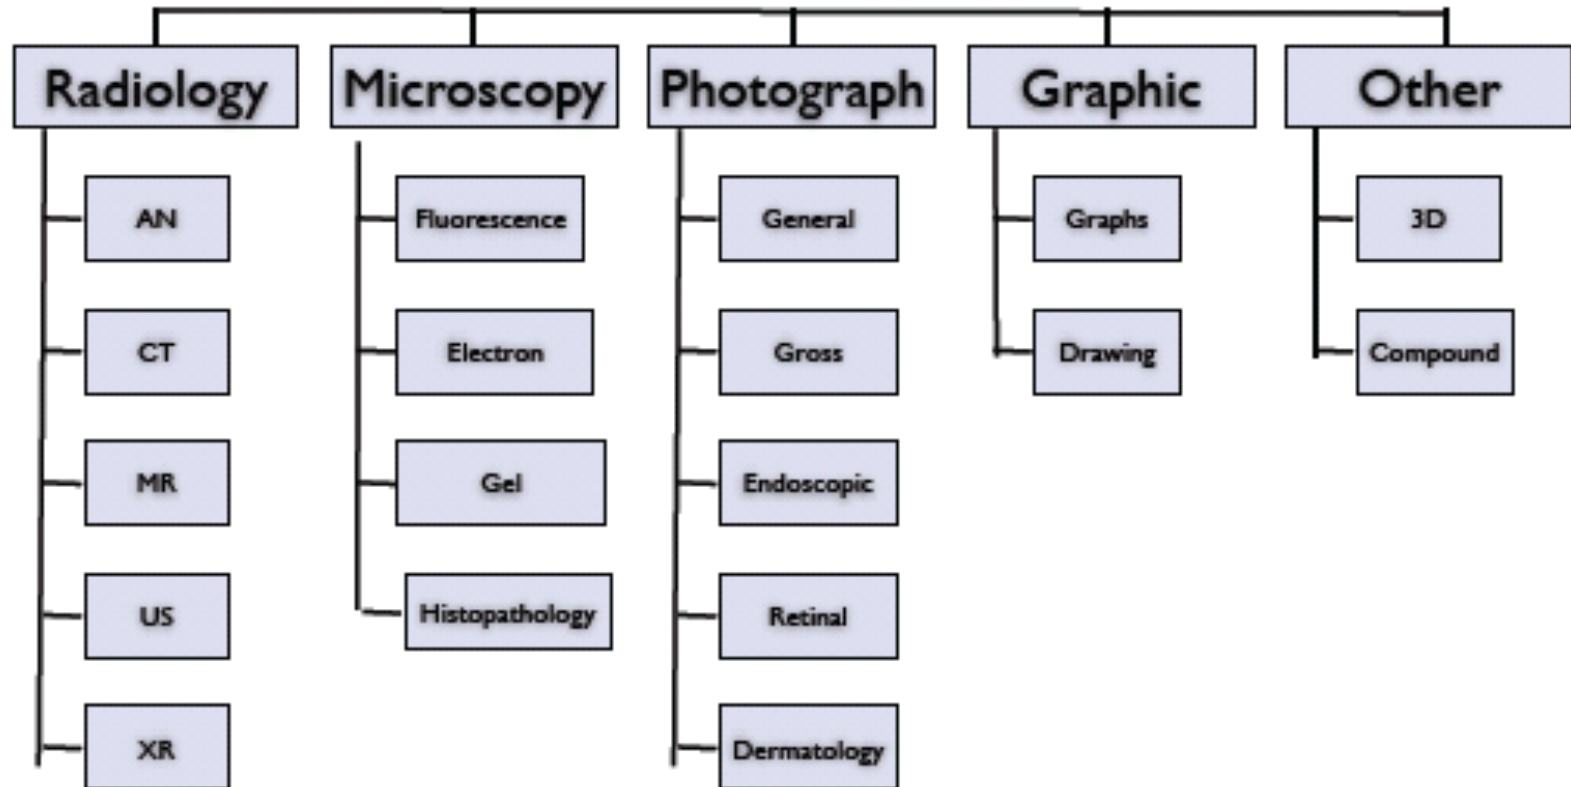

128	135	166	138	190	132
129	255	105	189	167	190
229	213	134	111	138	187

128	138	135	190	166	132
129	189	255	167	105	190
229	111	213	138	134	187

Color Planes

modality classification

Goals of Image and Video Analysis

- Segment an image into useful regions
- Perform measurements on certain areas
- Determine what object(s) are in the scene
- Calculate the precise location(s) of objects
- Visually inspect a manufactured object
- Construct a 3D model of the imaged object
- Find “interesting” events in a video

3D Sensors

- Laser range finders
- CT, MRI, and ultrasound machines
- Sonar sensors
- Tactile sensors (pressure arrays)
- Structured light sensors
- Stereo

■ **MRA (angiograph)**
showing blood flow.

Areas where imaging is used

- Medical imaging
- Remote Earth resource observations
- Astronomy
- High-energy plasmas and electron microscopy

Imaging Examples

1. Brain MRI

2. Cardiac CT

3. Fetus Ultrasound

4. Satellite image

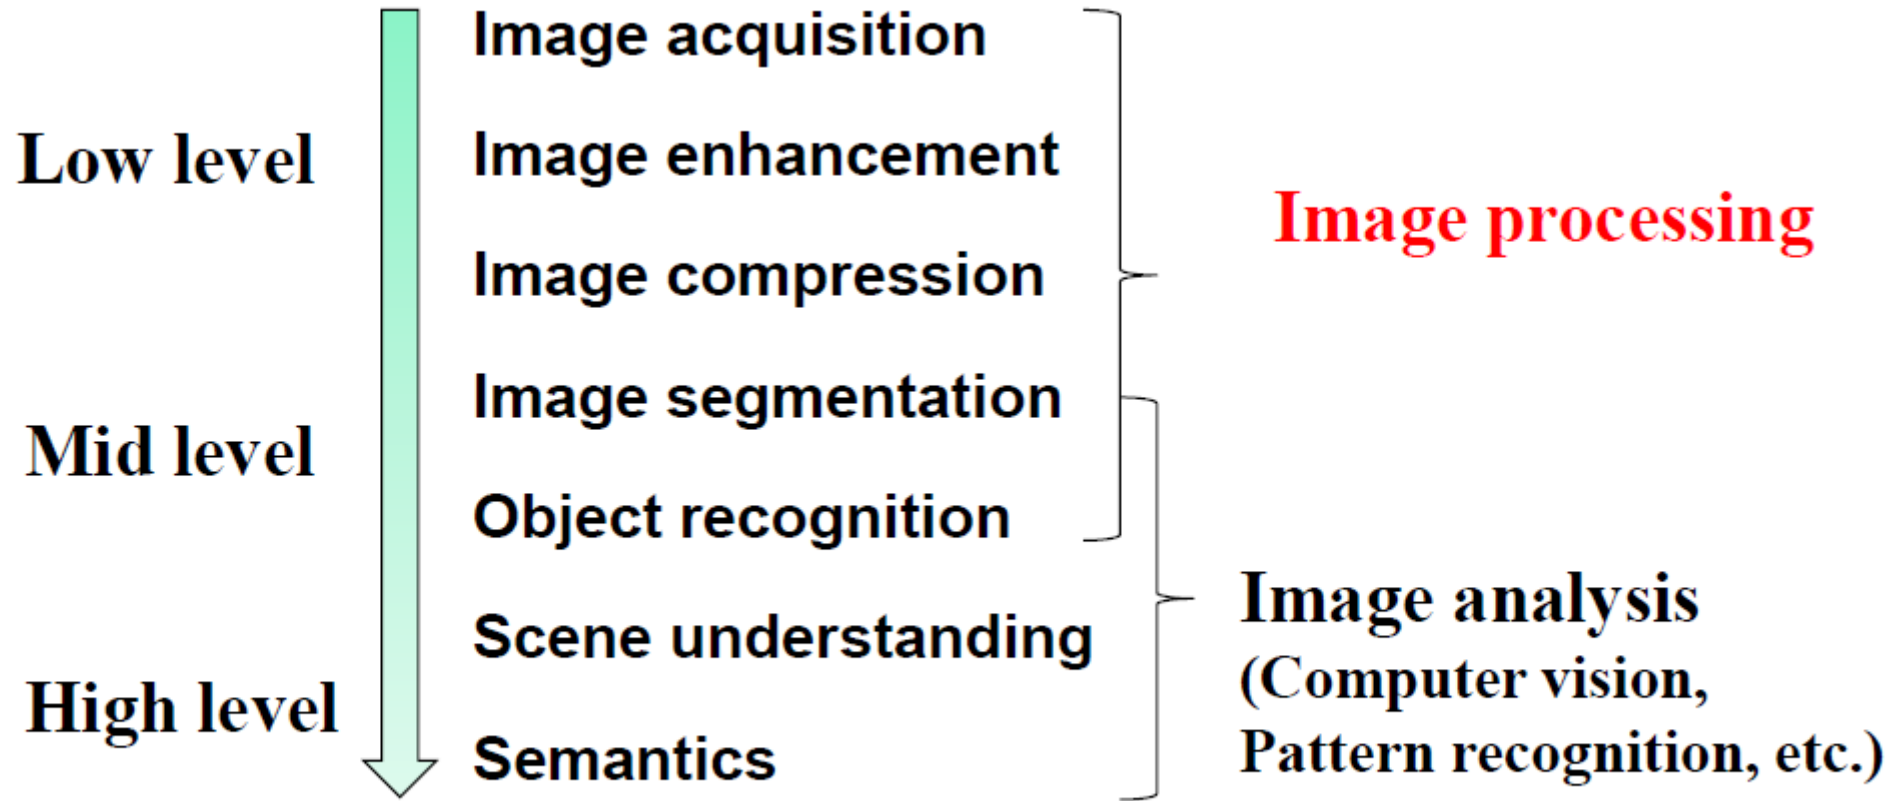

5. IR image

From Processing to Analysis

Fundamental Steps in Digital Image Processing

- Methods whose input and output are images
- Methods whose outputs are attributes extracted from those images

Flow of Digital Image Processing

Image acquisition: It deals with capturing images or samples.

Image enhancement: It deals with the improvement of quality of images.

Image representation: It deals with different ways in which image can be represented mathematically, graphically and statistically.

Image transformation: It is used to transform the input image from one domain into another, e.g. an image in spatial domain can be converted into frequency domain by using Fourier transform.

Image restoration: It deals with the analysis and modeling of different types of noise mixed in images.

Color image processing: Various colour spaces and formats are covered in it.

Flow of Digital Image Processing

Image compression: It is used to reduce the size of image or reduce redundancy without any significant change in the inherent content of the image.

Morphological image processing: It is used to represent or convert into suitable forms so that edges can be easily recovered. These operations are generally used with image segmentation.

Image segmentation, representation and description: The selected region of interests can be extracted and various boundaries, edges and other similar information could be obtained.

Object recognition: It deals with the pattern recognition and matching.
